Run the URSIM in terminal ros2 run ur_client_library start_ursim.sh -m ur10e

```
done

akhater@akhater-Precision-Tower-5810:~$ ros2 run ur_client_library start_ursim.s
h -m ur10e

ursim_net already exists
3c8dc95607bbf6d320af13fb45f34d6cae5e12b6e033b5342a23d15687eb6248

Docker URSim is running

To access Polyscope, open the following URL in a web browser.

http://192.168.56.101:6080/vnc.html

To exit, press CTRL+C
```

Open link http://192.168.56.101:6080/vnc.html

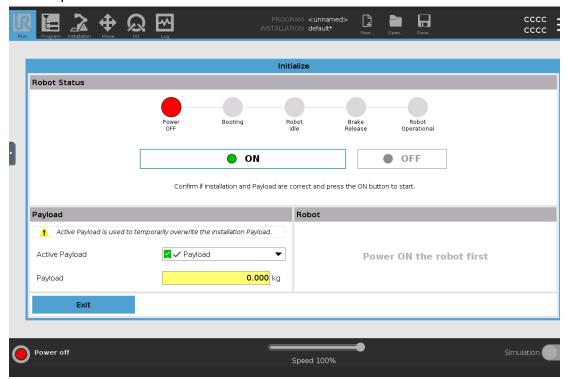

Connect

Go to Installation>URCaps>Host IP

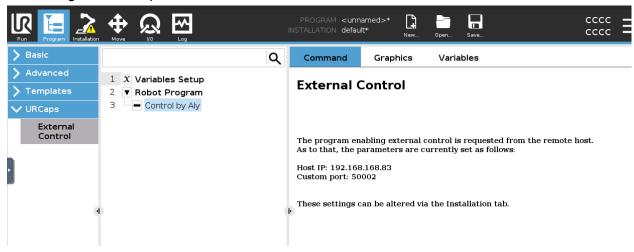

Input host computer IP. Keep port 50002

Power up the robot in the bottom left corner

Turn it ON until Robot Operational is GREEN

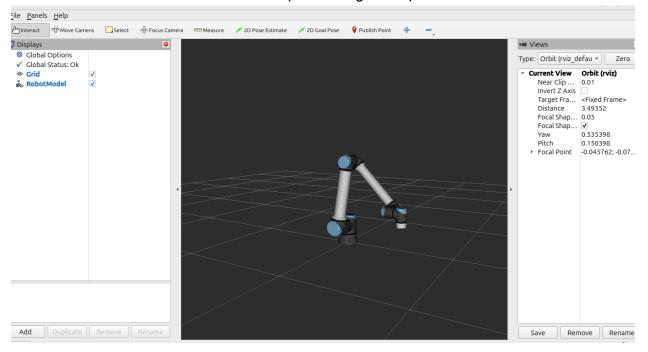

Go to Program>URCaps and click on External Control. Screen should look like this

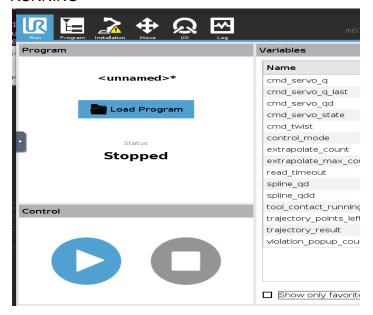

Control by Aly indicates that the program has been set up for external control.

Go back to the terminal, open a new terminal and run the drivers ros2 launch ur_robot_driver ur_control.launch.py ur_type:=ur10e robot_ip:=192.168.56.101 launch rviz:=true

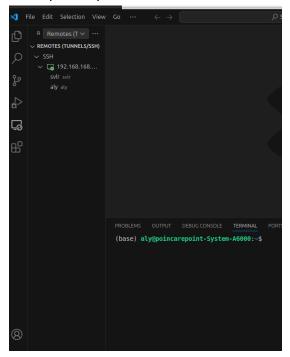

An RVIZ model of the ur10 will now show up according to the position in the sim

Go back to the URSim, in the RUN tab, hit the play button. The status should change to RUNNING

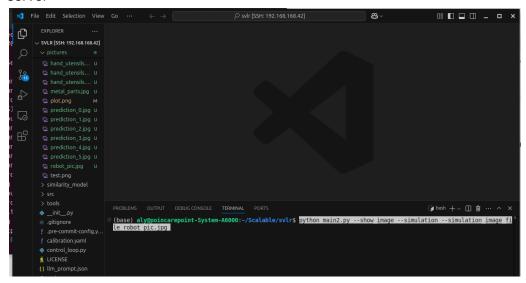

Open up VSCode, use the Remote Extension to connect to the Remote server in HMI2 Lab. It will request a password.

In the vscode terminal, do the following commands. (if the environment has been set up already) conda activate svlr cd Scalable/svlr

In the vscode remote, run the following python main2.py --show_image --simulation --simulation_image_file robot_pic.jpg

Note: The image can be an image uploaded to the Scalable/svlr/pictures folder on the remote server

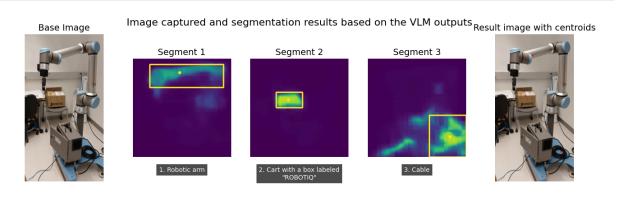

This will run the Server, and it will be waiting for a client to connect (the host pc) Now go back to the host pc terminal and go to cd Desktop/urscripts

Run the following in the terminal python3 remote_send_sim.py

Go back to the server terminal, it will request for user input from the image given. You can tell it to move a specific object in the image.

You will get an output picture and segmentation from the VLM

The server terminal will then output the actions needed to perform the task. It will send the actions and positions to the client (host pc) to send the command to the UR10 robot

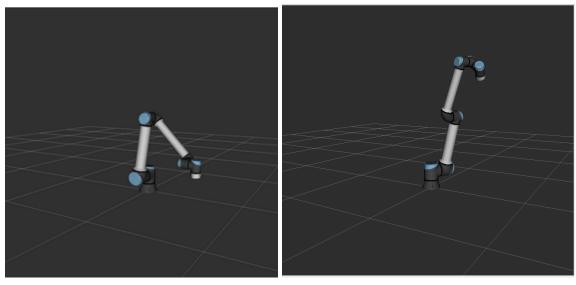

```
akhater@akhater-Precision-Tower-5810:-/Desktop/urscripts$ python3 remote_send_si
m.py

Connected to server at 192.168.168.42:8000
